INTRODUCTORY NOTES

The method of constructing the indices of agricultural production for the Latin American countries in this publication is basically the same as that used in the January 1966 publication. Annual time series have been extended one year. Major changes include the addition of one new country, Guyana; summaries, by country, of livestock production indices; and aggregate values of agricultural and food production.

The base period used for all indices is 1957-59. Farm commodity prices in local currency units are averaged and converted to dollar equivalents per metric ton for direct use as base-period price weights. The average base-period prices are multiplied by quantity of production for each commodity and aggregated into a total value of production, expressed in U.S. dollars, and used in constructing indices of total production. Population relatives used to construct indices of per capita production are based upon midyear population estimates provided by the U.S. Agency for International Development. The 1958 population is used for the base period.

All time references are to the calendar year. Calendar year data combine output of livestock products with crops harvested entirely or principally in the year shown. For countries where there is more than one harvest for a crop, such harvests are aggregated on the above basis.

Total value of output for livestock products includes additions for exports and reductions for imports of slaughter cattle. The net values of livestock, food, and agricultural production include deductions for the estimated value of crops fed to livestock. These feed deductions are established as a fixed percentage of the value of livestock output for each country, based upon relationships existing during the base period. Adjustments are made when the value of trade or crops fed is equal to or exceeds 10 percent of the gross value of livestock products included in the country indices.

Production statistics are those agreed upon and used as official USDA estimates by the Foreign Agricultural Service when available. Other estimates are by the Economic Research Service based on official and unofficial reports and estimates by governments, commodity groups, U.S. agricultural attaches, and foreign marketing specialists.

Production is expressed in metric tons (2,204.6 pounds) and value in U.S. dollars. Sugarcane production is used for all countries except Colombia and Guyana where data are available only for sugar output. Milk production in most instances includes goat's milk; meat is on a carcass weight basis for all countries.

1/ Statistical compilations by Rena E. Perley.
